

Generative AI and its applications in creative fields

My current understanding of the field of generative AI is, I would like to think, advanced. However, the more I learn about the creative fields, the more I understand both the severe gap between the current technology of AI as we know it, and the full breadth of creative work. At some point, the weirdly inspiring emergence of “google deep dreams” has seemed to me as a flag bearing example of awesome technology on the edge of the impossible; and now I’m mortified by the increasingly evident friction caused by the offsprings of that area. To put it bluntly, generative AI is an incomplete tool used by many to compensate for their lack of talent, creativity, and will to suffer meaning. In some way it was expected, but never would have expected to feel like we had this little sense of what makes a person human.

That aside, we did move mountains and rivers to get to this point and despite the dark intent, we can still admire the sheer scale of progress. From the famous Will Smith eating spaghetti incident, where the horror of a malformed actor created via diffusion was so catastrophic, it became the funniest joke on the internet; to today, where an entire industry emergent out of pretending that generated content is real, and most can’t tell the difference anymore between it and fact. It’s so effective, it has become a tool of cultural war, information obfuscation, and the ultimate wish fulfillment fantasie they could ask for.
